Allowable Subject Matter

2. The following is an examiner's statement of reasons for allowance:
The prior art of the record fails to teach or suggest alone or in combination: A communications device for detecting user transmitted symbols encoded in spread spectrum waveforms (hereinafter "user waveforms") comprising: a third processing element, the third processing element generating a matrix (hereinafter "gamma matrix") representative of a correlation between a code associated with one user and those associated with one or more other users, wherein the gamma-matrix is a composition of a complex conjugate of the code associated with one user and a complex conjugate of the codes associated with the one or more other users, as recited respectively in claims 1 & 16 and in combination with other elements of the respective claims.

Claims 1, 3-5, 7 are allowed.

Claim 16 is allowed.

Art Unit: 2611

The prior art of the record fails to teach or suggest alone or in combination: A communications device for detecting user transmitted symbols encoded in spread spectrum waveforms (hereinafter "user waveforms") comprising: a set of one or more first processing elements, the set of first processing elements generates a matrix (hereinafter "R-matrix") representative of cross correlations among user waveforms, a third processing element, the third processing element generating a matrix (hereinafter "gamma matrix") representative of a correlation between a code associated with one user and those associated with one or more other users, wherein the set of first processing elements generate the R-matrix as a composition of the gamma-matrix as recited respectively in claims 8, 18, 27 and in combination with other elements of the respective claims.

Claims 8, 18, 27, 25 are allowed.

The prior art of the record fails to teach or suggest alone or in combination: A communications device for detecting user transmitted symbols encoded in spread spectrum waveforms (hereinafter "user waveforms") comprising: a set of one or more first processing elements, the set of first processing elements generates a matrix (hereinafter "R-matrix") representative of cross correlations among user waveforms, a host controller coupled to each of the set of first processing elements, wherein the host controller generates a partitioning of the R-matrix, that partitioning divides the R-matrix, into one or more portions based on a number of users and a number of available

Art Unit: 2611

processing elements, the host controller assigns to each first processing element a portion of the R-matrix to generate according to the partitioning, each of the first processing elements generating the assigned portion of the R-matrix according to the partitioning, the host controller re-calculates the partitioning of the R-matrix when a user is added or removed from the spread spectrum system, and assigns a new portion of the R-matrix to each first processing element according to that new partitioning, as recited in claim 9 and in combination with other elements of the claim.

Claims 9-10 are allowed.

The prior art of the record fails to teach or suggest alone or in combination: A communications device for detecting user transmitted symbols encoded in spread spectrum waveforms (hereinafter "user waveforms") comprising: a set of one or more first processing elements, coupled to a direct memory access engine (hereinafter "DMA engine"), the set of first processing elements generating a matrix (hereinafter "R-matrix") representative of cross correlations among user waveforms, a host controller coupled to each of the set of first processing elements, the host controller generating a partitioning of the R-matrix, that partitioning divides the R-matrix into one or more portions based on a number of users and a number of available processing elements, the host controller assigning to each first processing element a portion of the R-matrix to generate according to the partitioning, each first processing element generating the assigned portion of the R-matrix according to the partitioning, the host re-calculating the partitioning of the R-matrix when a user is added or removed from the spread spectrum system, and assigning a new portion of the R-matrix to each

Art Unit: 2611

first processing element according to that new partitioning, as recited in claim 11 and in combination with other elements of the claim.

Claims 11,13-15, 17, 20 are allowed.

The prior art of the record fails to teach or suggest alone or in combination: A communications device for detecting user transmitted symbols encoded in spread spectrum waveforms (hereinafter "user waveforms") comprising: a third processing element, the third processing element generating a matrix (hereinafter "gamma-matrix") representative of a correlation between a code associated with one user and those associated with one or more other users, wherein the third processing element updates the gamma-matrix as users are added or removed from the spread spectrum system, as recited in claim 21 and in combination with other elements of the claim.

Claims 21, 23-24, 28-29 are allowed.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
